

Räumwerkzeughalter für Innenprofile Broaching toolholders for internal profiles

Zylinderschaft / Cyl. shank, VDI DIN 69880
HSK DIN 69893, ISO 26623

Katalog Nr. 152
Catalogue No. 152

Räumwerkzeughalter für lageorientierte Kontur
Broaching toolholders for correctly aligned contour

Sonderprofile auf Anfrage
Special executions on inquiry

Zur Herstellung von Innenprofilen in selbstschneidender rotierender Bauweise zur Schonung Ihrer Werkzeugmaschine.

Folgende Zuern-Räumwerkzeughalter sind lieferbar:
Zylinderschaft, VDI - DIN 69880, HSK - DIN 69893 und Polygonschaft - ISO 26623.

In Standardausführung werden die Räumwerkzeughalter mit zusätzlichen Kühlkanälen direkt zur Schneide geliefert.

Die Räumstempel sind TIN beschichtet für hohe Standzeit.

Anwendungsvideo siehe:
User-video see:
www.zuern-tools.de

Empfohlene Anwendung beim Räumen auf CNC-Maschinen:

- Die Bohrung sollte min. das Profilmaß haben, wenn möglich 1% grösser als das Profilmaß.
- Bei Sacklochbohrungen sollte die Bohrungstiefe ca. 1,5 x Profiltiefe sein.
- Die Ansenkung der Bohrung sollte min. dem Außendurchmesser des Profils entsprechen.
- Werkzeugaufnahme im Revolver muss zentrisch stehen - evtl. Kontrolle mit Kontrolldorn !!!
- **Zuern-Räumstempel ø08x28** (evtl. mit Reduzierung 1208.5000) mit Spannschraube im Räumhalter spannen.
- **Zuern-Räumstempel ø12x55** mit Spannschraube im Räumhalter spannen.
- Kühlmittelzufuhr extern oder intern anwählen je nach Maschinentype.
- Der Räumwerkzeughalter mit eingespanntem Räumstempel wird zentrisch im Eilgang vor die vorgearbeitete Bohrung gefahren.
- Die Drehzahl des Werkstückes entspricht etwa der Schnittgeschwindigkeit von HSS-Werkzeugen bei gleichem Werkstoff und Bohrungsdurchmesser, jedoch sollte 2.000 U/min nicht überschritten werden.
- Der Vorschub in Schneidrichtung ist zwischen 0,01 und 0,1 pro Umdrehung zu wählen.
- Der Rückzugsvorschub kann zwischen 0,1 und 0,5 mm pro Umdrehung liegen.
- Bei höheren Drehzahlen kann es von Vorteil sein zuerst mit geringer Drehzahl zu beginnen bis der Räumstempel die Spindeldrehzahl angenommen hat und dann erst auf die volle Drehzahl zu fahren.
- Bei geringer Abnutzung der Schneidkanten kann der Räumstempel stirnseitig bei einem Winkel von 4 - 8° nachgeschliffen werden.

For efficient production of hexagon or splined profiles in components made from a wide range of materials on CNC lathes and turning centres.

The Zuern range of broaching toolholders are available with the following shank options:
Cylindrical shank, VDI - DIN 69880, HSK - DIN 69893 and polygonal shank - ISO 26623.

The broaching toolholders are supplied as standard with a through toolholder coolant channel to provide coolant directly to the cutting edge, promoting longer tool life.

The broaching cutters are TIN coated for the same reason.

Instruction for using the broaching heads & cutters on CNC lathes / turning centres:

- The broaching toolholder must be aligned with the machine centreline and the use of a setting arbor in the machine turret is recommended, prior to mounting the toolholder.
- The component should be drilled and the drill must be a minimum of 1% larger than the across flats dimension of the required hexagon.
- For blind hexagon holes the drilled hole depth must be at least 1.5 x the required length of hexagon section. (This is to allow space for the broached material swarf, to form in the bottom of the blind hole.)
- Clamp the **Zuern-broaching cutter ø08x28mm** (possible with reduction 1208.5000) into the broaching holder using the hexagon screws provided.
- Clamp the **Zuern-broaching cutter ø12x55mm** into the broaching holder using the hexagon screws provided.
- Select via the machine system external or internal coolant, for the use during machining.
- The surface speeds used to broach the components should be based on the speeds when machining the same component material an HSS cutter, but should never exceed 2000 RPM.
- The feed used should be between 0.01 mm and 0.1 mm / revolution.
The return feed is to select between 0.1 mm and 0.5 mm / revolution.
- When broaching a new component for the first time it is always advisable to take few test cuts at the lower feeds and speeds and then increase them until a suitable feed and speed is found, enabling efficient and fast production of components.
- Experience has shown that even where upper range of feeds and speeds can be used it is advantageous to commence the broaching operation at a lower speed and feed until the broaching cutter is settled inside the drilled hole and then increase the speed and feed upwards to the selected maximum via the machine control.
- Subject to cutting edge wear the broaching cutter can be reground on the face, at an angle of 4 - 8°.
- Replacement cutters are readily available from the toolholder supplier.
